Object: Mounting instructions internal HDD

Pages: 1

Dear Stephen,

Please find below the text you can use as mounting instructions for the internal hard disk drive:

1. Installing your hard disk drive

**Note: turn off the system power!!!**

*Cover opening mechanism and the location of the hard disk drive may vary from one computer to another.*

- A. Turn off the computer, unplug the external cables and open computer cover. Mount the hard disk drive in the designated place in the computer with screws adapted to the product.
- B. Connect pin interface cable and power cable. Make sure that the direction of the cables is correct and matches the shape of the receptacles when connecting cables. Incorrect cable connection may damage the hard disk drive.

2. Making computer detect the new device

*Run the CMOS (BIOS) set-up program to detect the new hard disk drive.*

- A. Go into CMOS screen during the booting of the computer.
- B. Make the computer detect the hard disk.
  - a. If your computer supports IDE HDD Auto Detection, the hard disk drive will automatically be detected.
  - b. If your computer does not support auto detect, go into the User Define Mode and by referring written information on the product, set the correct settings for cylinder, head and sector and if some BIOS must be, set the HDD mode to LBA.
  - c. Save the changed details and exit.

3. Partitioning and formatting the drive

*Refer to your operating system manual or system manual for partitioning and formatting.*

Kind regards,

Celine
